## Appendix B. Categories of Formal Education

#### Categories used in 1991:

- 01. None: Still at school
- 02. Special school qualification, completion of a special school
- 03. Lower secondary school qualification, no completion of compulsory education (Grund-/Volksschule ohne Abschluss)
- 04. Lower secondary school qualification, completion of compulsory education (Grund-/Volksschule mit Abschluss)
- 05. Middle school qualification (Mittlere Reife)
- 06. Polytechnical secondary school qualification, completion of 8th form (POS, Abschluss 8. Klasse).
- 07. Polytechnical secondary school qualification, completion of 10th form (POS, Abschluss 10. Klasse)
- 08. Extended secondary school without certificate
- 09. Abitur (Hochschulreife)
- 10. Other school qualification
- 11. No school qualification
- 98. DK
- 99. NA

#### Categories used in 1996 and 2000:

- 01. still a pupil at a full-time school of general elementary education or of intermediate general qualification or of higher education (maturity level) ("allgemeinbildende Vollzeitschule")
- 02. still a pupil at a school for intermediate vocational qualification. ("Berufsorientierte Aufbau-, Fachschule o.ä.")
- 03. left school without a certificate of general elementary education or of intermediate general qualification. (before having reached the 8th, 9th, 10th, or 11th grade)
- 04. Certificate of General Elementary Education ("Volks-, Hauptschulabschluss")
- 05. Certificate of Intermediate Vocational Qualification or of Intermediate Formal Education ("Mittlere Reife, Realschulabschluss, Fachschulreife")
- 06. Certificate of "Polytechnische Oberschule" after eight years of education
- 07. Certificate of "Polytechnische Oberschule" after ten years of education
- 08. Certificate of Secondary Vocational Qualification ("Fachhochschulreife, Fachgebundene Hochschulreife, Fachoberschule")
- 09. Certificate of Secondary Formal Education ("Abitur, allgemeine Hochschulreife, Erweiterte Oberschule (EOS)")

## **Appendix D. Description of Weight Variables**

The survey institute provided a weight variable for the data set (V2139). This weight variable accomplishes two things: it corrects for the selection bias due to household size (respondents within large households have a smaller chance of being selected than respondents from small households) and it corrects for distribution skewness produced by refusals and other non-neutral reasons for not completing an interview. For this latter correction the weight construction uses an iterative proportional fitting procedure by which observed combinations of respondent attributes are fitted to tables of combined attributes of other large data sets, e.g. census data.

Based on census data of 1995 (December 31, 1995) the following variables were employed in the fitting procedure: *länder*, community size, and respondent's sex and age. Based on the East's six *länder* and the West's 11 (counting West and East Berlin as two separate *länder*), on five classes of community size and on five age groups, the Western weight matrix contains 223 and the Eastern matrix 122 cells.

After the 1996 data set had been produced an alternative weight variable was created that would be applicable to both the 1991 and the 1996 surveys. It should be noted that in 1991 a different survey institute (infas, Bonn) was involved. This meant that statisticians of both institutes had possibly used different fitting procedures and different break-down categories for the tables. Another problem was that it could not be reconstructed whether in 1991 a table of all possible combinations of attributes was used for an iterative simultaneous fit, considering all possible interactions, or whether independent runs for some of the attributes were made. Finally, in working with the data from the two different years consideration had to be given to the fact that in 1991 the East had been overrepresented by about 1.5, whereas as in 1996 the overrepresentation was 2.5.

Joining the 1991 and 1996 data sets, therefore, a new weighting variable for the East and the West was constructed (V2145), also based on iterative proportional fitting involving *länder*, community sizes, sex, and age. Community size and *länder* were estimated separately, however, because of not available tables for very small communities as a consequence of German data protection laws.

In addition a weight variable V2147 was constructed reflecting the actual distribution of cases in 1991/1996 and East/West which should be used when comparing East and West Germany across the two time points of measurements.
